ARAI: FORENSIC EVIDENCE & SECURITY PROTOCOL (v1.1)

1. PURPOSE

This protocol establishes the mandatory Chain of Custody for digital evidence collected by participants of the Afrikaner Rights Advocacy Initiative (ARAI). The goal is to produce an auditable evidence record for U.S. House Judiciary and OIG submission that is structurally forensic, legally admissible, and resistant to administrative dismissal.

2. FORENSIC INTEGRITY STANDARDS

To ensure evidence is resistant to being labeled "advocacy noise," all data must adhere to these standards:

- **Manual Provenance:** Evidence must be captured via native browser interfaces (DevTools: Inspect Element > Network > Fetch/XHR). Automated scripts, API scrapers, and third-party injection tools are **strictly prohibited**. Use of such tools creates 'System Abuse' flags and compromises the legal integrity of the dossier.
- **Chain of Custody:** Each capture must be logged with a SHA-256 hash to prove no post-capture alteration occurred.
- **Privacy-First:** No PII (names, A-Numbers, physical addresses) shall be submitted to the aggregate database. All submissions must be self-redacted by the participant.

3. EVIDENCE CAPTURE METHODS

- **Method A (Desktop/Laptop):** Use native browser tools (F12 > Network > Fetch/XHR). Export the case-status API request as a .HAR file. Calculate the SHA-256 hash (Windows: `certutil -hashfile [filename].har SHA256` | macOS/Linux: `shasum -a 256 [filename].har`). Log metadata in the Chain-of-Custody Log.
- **Method B (Mobile - Live Recording):** Use native OS screen recording. Ensure the system clock is visible in the status bar for the duration of the recording. Record from login through portal navigation to the final status page.
- **Method C (Mobile - PDF Export):** Use the browser "Save as PDF" function—not a screenshot. This preserves URL and rendering metadata for audit.

4. CHAIN-OF-CUSTODY LOG TEMPLATE

Every volunteer must maintain this log sheet. Do not submit data without logging the metadata.

Field	Description
Date/Time	Must include timezone (SAST).
Capturer	Name of the person performing the capture.
Method	DevTools HAR, Screen Record, or PDF Export.
File Name	Exact file name as saved.
SHA256 Hash	Mandatory for all .HAR files.
UI Status	As displayed on-screen.
Backend Status	Raw JSON status field (if visible/captured).
Witness	Second-party witness (if applicable).

5. URGENT SECURITY ADVISORY: THE "BOT" TRAP

Third-party actors recommending "Tampermonkey," "Violentmonkey," or "hacking" scripts to "fix" portal visibility are creating a death warrant for refugee claims. **DO NOT INSTALL THESE.**

The Risks:

- **Systemic Flagging:** USCIS monitors traffic via Cloudflare/Akamai. Automation turns your account into a "Bot" account, triggering permanent security locks/denials.
- **Pretext for Denial:** USCIS may cite unauthorized script injection under INA §212(a)(6)(i) (fraud/misrepresentation) as a permanent bar.
- **Identity Theft:** Scripts often "phone home," harvesting your A-Number, status, and biographical data, or providing the attacker with your session token to withdraw your application.

MANDATORY SECURITY CHECKLIST:

1. **Audit Browsers:** Delete all unauthorized browser extensions immediately.
2. **Password Rotation:** Rotate your MyCase portal password immediately.
3. **Clean Environment:** Use "Incognito" mode with zero extensions. Never paste portal data into public AI bots.
4. **Report:** If pressured by a group leader to use "Tampermonkey" or "Bypass Tools," report the tool name to the ARAI Data Custodian immediately.

THE "FORBIDDEN" LIST:

- **Script Managers:** Tampermonkey, Violentmonkey, Greasemonkey.
- **Browsers for Automation:** Kiwi Browser, custom "Hacked" browsers, or browsers with "case tracking" extensions.
- **Botting Tools:** Selenium, Puppeteer, Playwright (or any "auto-click" tools).
- **Unverified VPNs/Proxies:** These intercept your data before it reaches the government.

SECURE PORTAL ACCESS PROTOCOL

To maintain evidentiary integrity, follow this protocol 100% of the time:

- **Standard Browser Only:** Use a clean, updated version of Chrome, Firefox, or Edge.
- **Incognito/Private Mode:** This ensures no "shadow" scripts from other sites are running.
- **Zero Extensions:** Your browser should be completely empty of extensions.
- **Native Tools Only:** We use ONLY the browser's native "Developer Tools" (F12). These are passive, read-only tools.
- **No AI Interpretation:** Do not paste raw portal data into ChatGPT. This leaks your A-Number to global databases.

THE "GOLDEN RULE" OF DATA

Any "solution" that requires you to install code is a trap. The government portal is a secure environment. The only people who benefit from you adding "extra tools" are the parties who want to scrape your sessions, steal your case data, or frame you for "hacking" to justify a Fraud Bar.

The Auditor's Stance: ARAI only uses manual inspection. We don't hack the system; we hold it accountable by documenting its own contradictory data. We keep your portal clean, your A-Number safe, and your evidence untainted.

Data Custodian: ARAI **Protocol Version:** 1.1 (Audit-Grade) **Submission Deadline:** October 5, 2026 **Secure Outreach:** afrikaner.advocacy.audit@proton.me | afrikaner.advocacy.audit@outlook.com
